

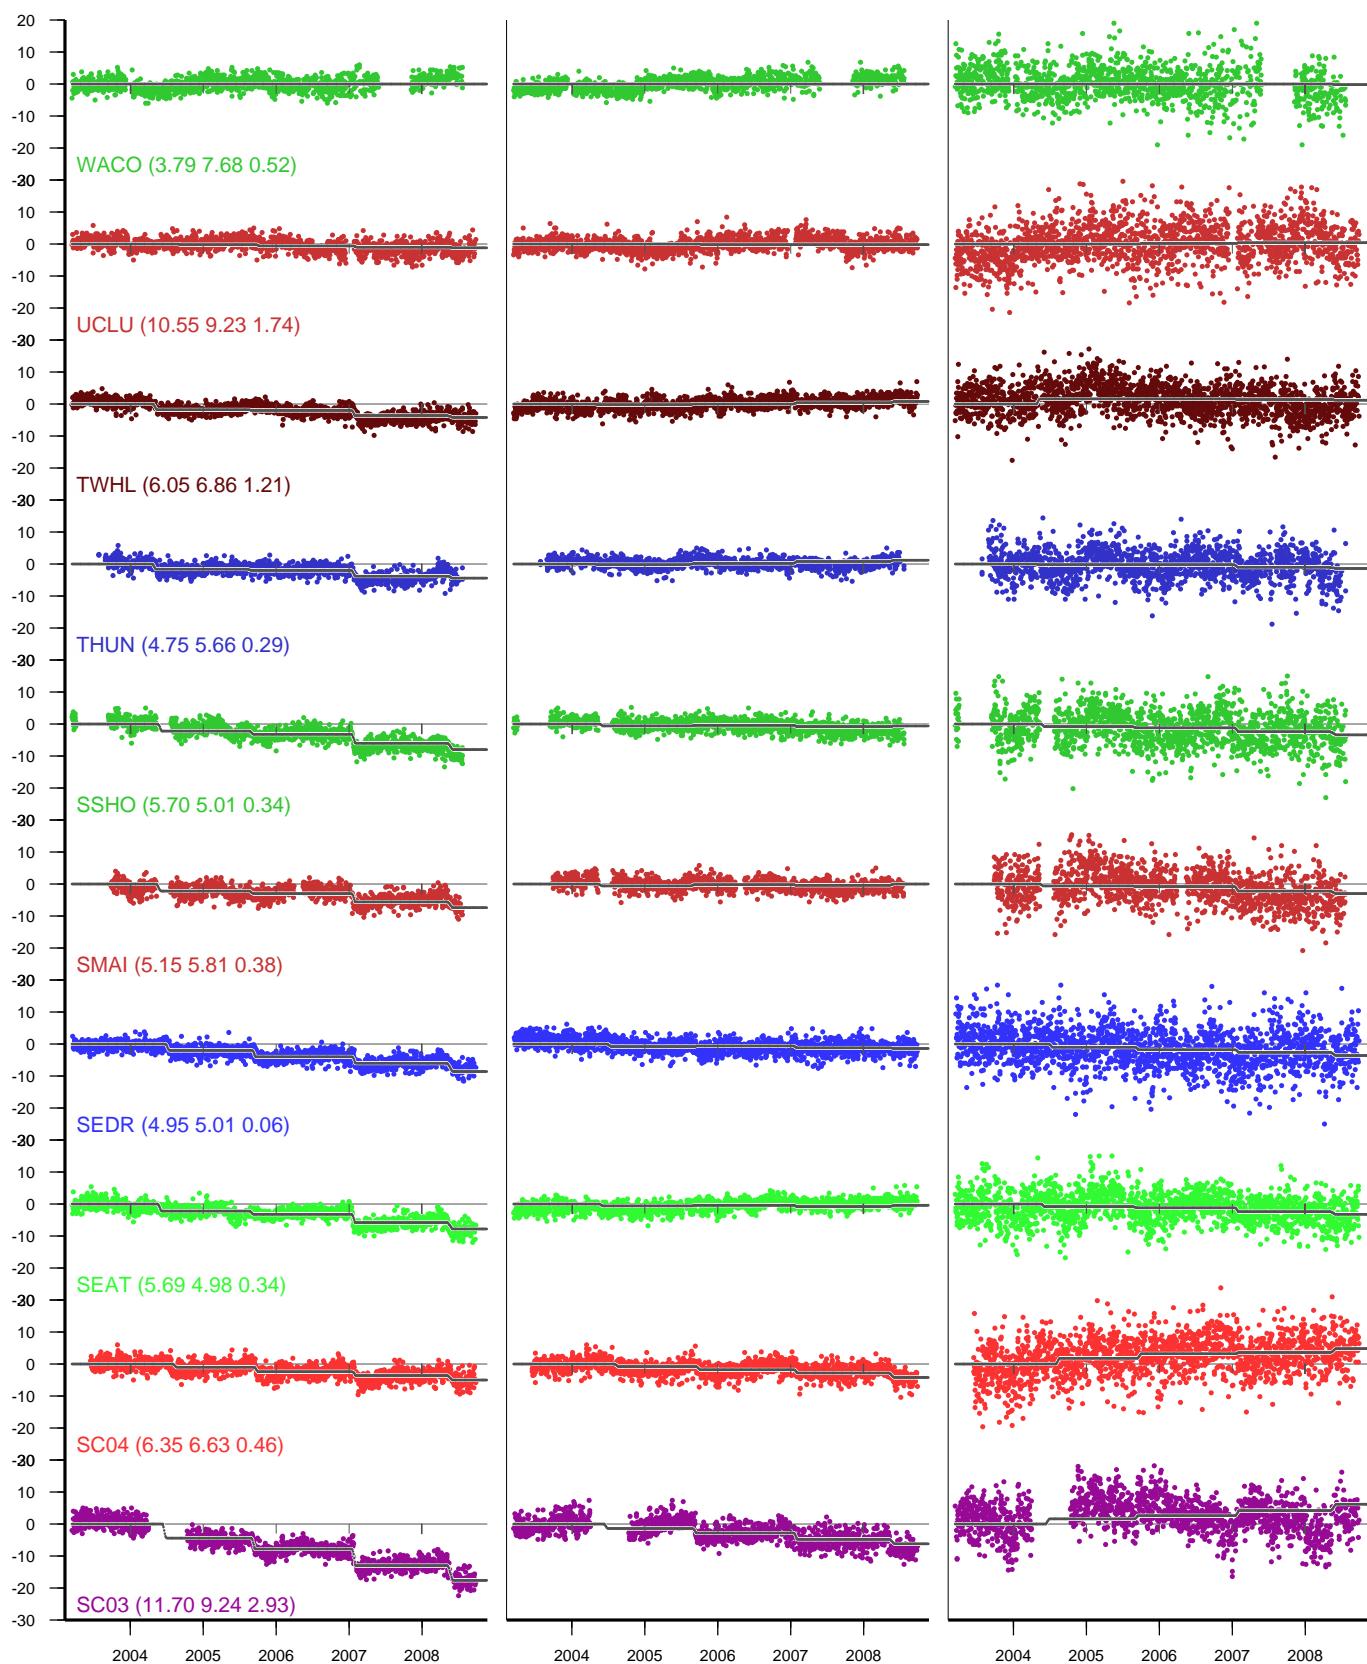

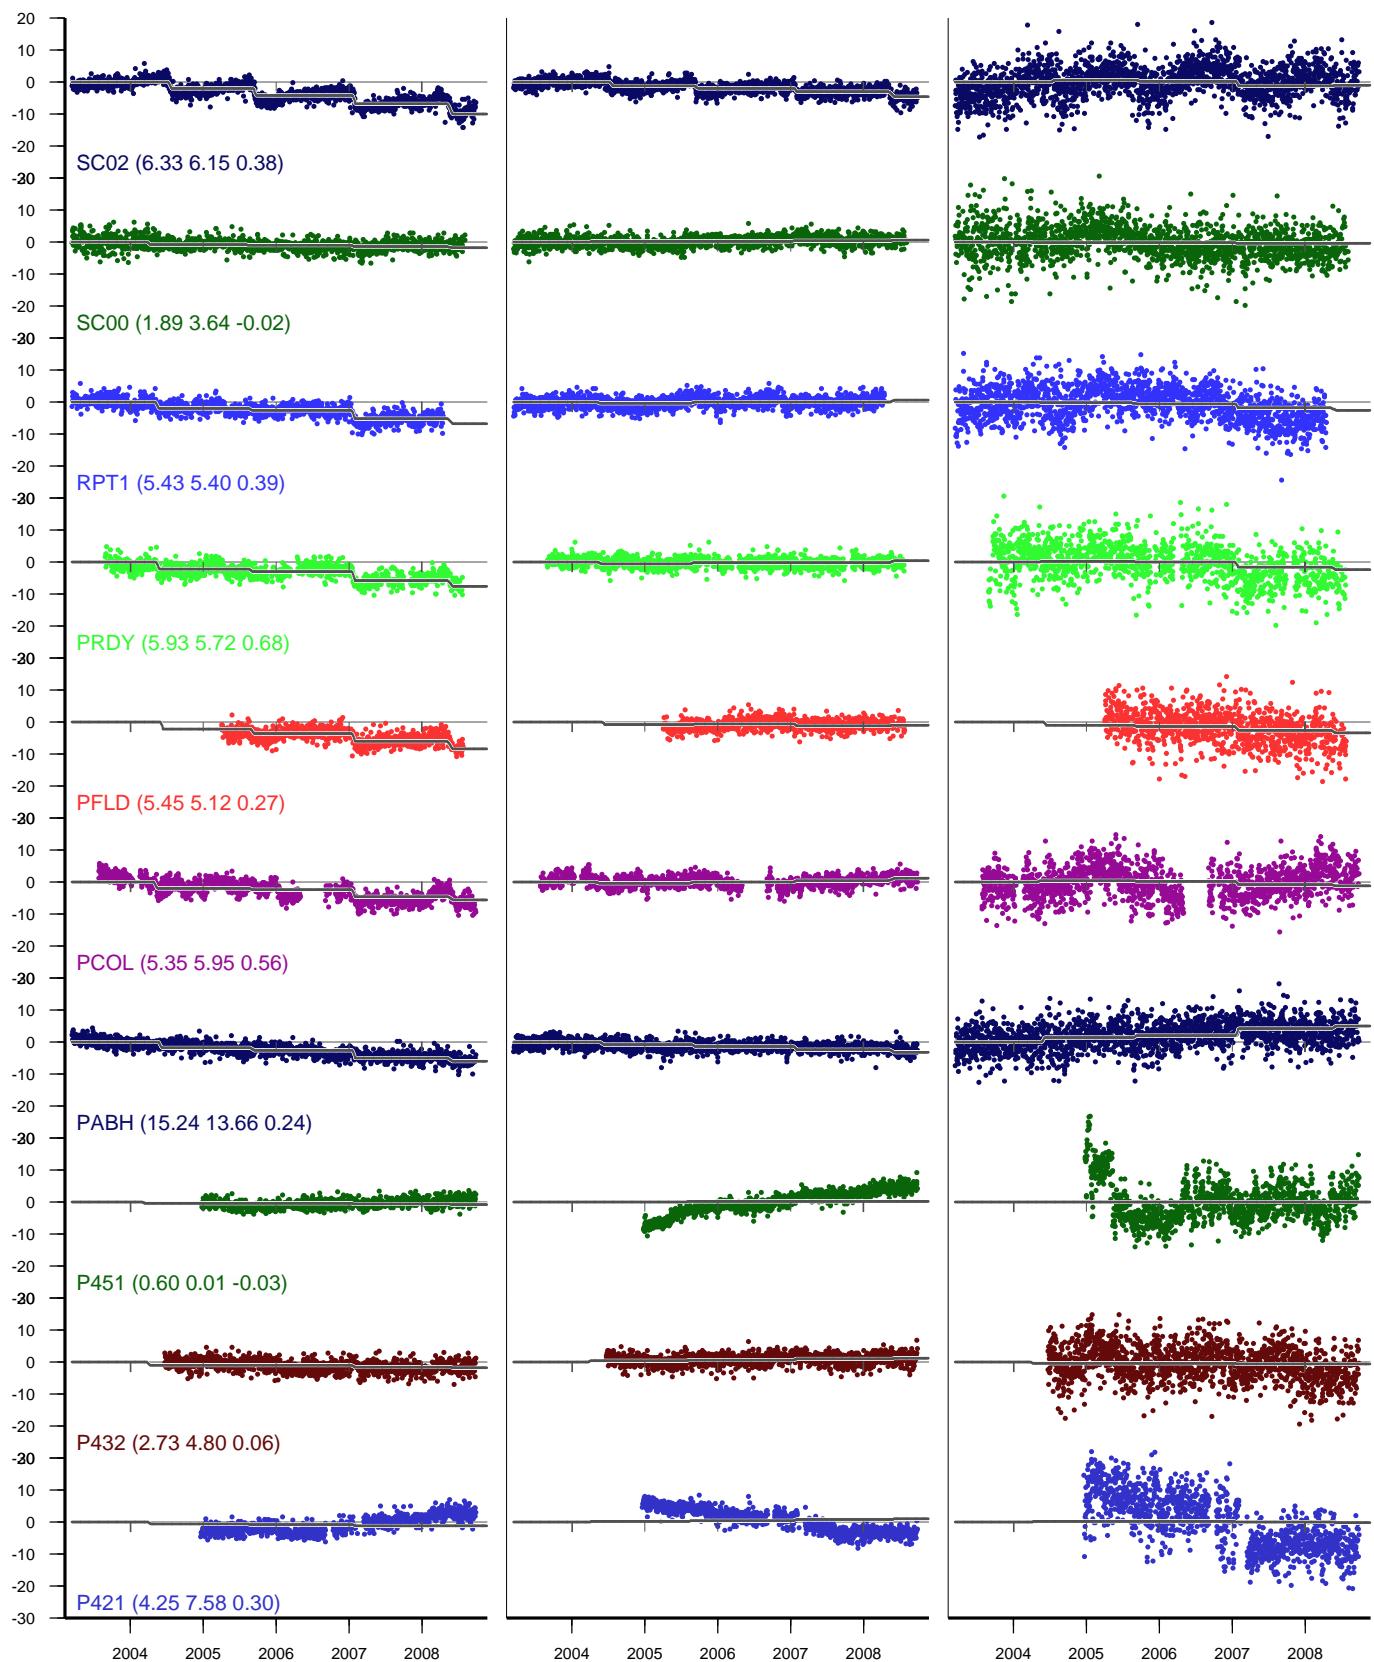

Figure A8. Time series for all sites used in the inversion. The colored dots are the observed positions and the black lines are predicted time series. The site names are in the same color as the corresponding time series and are followed by the steady velocities (East North Up) in mm/yr. The time series have had their steady velocities removed, that is, the vertical axis (in mm) is $X - V t$, where X is the position at time t and V is the steady velocity. The horizontal axis is in years. The times series at left show the East component, North component in center and vertical (Up) at right.
